## eA correction of Errors

lar and difference of tatitude ate proportionable. Whereof it followeth that fo oft as one of thele equall parts of the difference of latitude is contained in the fegment of the rumbe betwixt the two places(which before wee hewed to bee fo oft as a degree of the meridian in the globe, is contaned in the fegment of the rumb betwixt the fame places in the globe) fo oft is one of the faid equal parts of the perpendicular aforefaide (that is a degree of the zquinoctiall) contained in the (egment of the fame rumbe betwceene the forelayde crofsing or ende of the perpendicular, and the aquinoctiall. Thereforelocke how many degrees of the equinoetiall there are found in the legment of the rumbeof the two places, fo many fcore legues is the diftance of thofe two places, which was to be demonftrated. -Thus haue you a way infallible to find out the diftance betweene any twoo places neafured in their rumbe : whilich becaufe it is then onely theiz true diffance (that is the horteft pace betwixt the vpon the fuperficies of the terreftriall.globe):when both places lie noreh and fouth each from other, or caft and weft, hauing no lattude : whereas otherwife the fegment ofthe rumbe betweene the two places is al waies greater(yea fometimes greater by halfe and more, in places farre nortbwardes or fouthwardes) then the true diftance : I thought goodalfo here to fette downe the way to finde out the true diftance of any two places, wherein I haue beene, and yetam publikely charged with my pre-: mife, and meane as this time to difcharge my felfe shereof.

## in the Fea Chart.

The true diftance betwixt twoo places is the arch of a great circle intercepted betwixt them, which is thus to be fou nd out.

If both places haue no latitude (as when they are both vider the xquinoctiall) and one of thern alfo no longiude, the longitude of the other being leffe, or not more then 180 . degrees : the longirude is the diftance.
But if the longitude be greater then 180 degrees,' fubtrat it our of 360 . the remainder is the diftance.
If both places haue either none or the fame lon: gitude(2s when they are in the fane femicircle of the meridian betweene the poles) and one of them onely haue latitude, that lacitude is the diftance. But ifboth places agrecing in long gitude haue lattudes alfo of like denomination (as both northerly, or both fourherly) fubtraat the leffer latitude out of the greater, the diftance remaineth. Ifone place haue northerly latitude, and the other foutherly ${ }_{z}$ adde them togecher, the fumme is the diffance.
If one or bort places haue latitude, and differ alfo in longitude: in a great circle diuided exactly into degrees (with figures fet to euerie fifth or tenth degrec) note the longitudes of both places.

Now if one place onely haue latitude, drawe a diameter from the longitude thereof, noted in the circle, and with your compafles take fo many degrees and minutes in the fame circle,as that latitude containeth : then fetting one foote of the compaf-

## in the feaCbart.

fes in the longitude of that place, with the other make a pricke in the circle, which may be called the poynt of latitude. From this poynt draw a line perpendıcular, crofsing the dameter drawne from the longitude of that place. Take with your compaffes the diftance of this crofsing, from the poynt of the other places longitude, noted in the circle, and leauing one foote in the fayde crofsing, with the other make a pricke, in the forefaid diameter: take the diftance of this pricke from the poynt of latitude noted in the circle. Then fetting one foote of the compaffes in that poynt of the circle where the degrees beginne to be numbred, the other foor extended that way, which the nübers proceed, hal Shewe you in the cirele the diftance of the places.
Take for example the cittic of Londow and Saine Thomas Iland, which lieth right vnder the aquinoctiall line, 1 n 32 degrees of longitude. The longitude of $L$ anden admisto be 22 degrees, the latitude si degrees, 32 minutes:Marke the fongitudes of Saint $T$ homas Iland and of London wivth A a'ld B. From the longitude of London. (becaufe London hath alfo latitude)draw the diameter B C. Hauing taken with the compaffes the latitude of London in the circle, let one foote in B , and with the: other make the pricke E in the circle, and draw the perpendicular $E F$, crofsing the diameter $B C$ at $F$. Make F G equall to FA. which is the diftance of Saint $T$ homas Iland from the fine of Londons latitude. Then $G$ E fhall bee the line fubtending the diftance of thore two places. Taking therefore the length of $G E$ with the compaffes, and fetting one

[^0]
## el correction of Errors

foote in H (where the degrees begime) the other flretched forwardes in the circle, will poynte you out the diftaunce of Saint $T$ homas Ilande and London, 52 degrees of a great circle, and about one halfe, that is, io so deagues, or 3 ro englifh miles.
If both places haue lacitude, do the like for both places as before you did for the one place hauing latiude, till you haue crofled beth diameters with. perpendiculars : then take with your compafles the diftance of thofe crofsings. Now if both their latitudes bee ofone denomination (that is, both nottherly or both foutherly)and equall, fette one foote of the compafles where the degrees begin to be numbred in the circle, and the other foote excended therein, that way which the numbers fucceede will thew you the diftance.
As for example, Londew and Cape Blanco fneare the coaft of new found land) haue both northerly. and.almoft equal latitude of $\mathfrak{r}$ degrees, 32 minutes: Hauing therefore drawne as well the diameters B Cand DI, from Badetermining the longitude of London(vie. 22 degrecs)and from the poynt of the longitude of Cape Blasuo (which admitte to be $33 \pm$ degrees, as alfo:the perpendiculars or fines of both their laitudes, EF, and K L, (as before was Ihewed) crofsing the diameters in F andL. The diftance $F$ L taken with the compaffes, and tranflated into the circle(as the former example) wil Shew you the diftance of cape Blanco from London, to bee almoft 31 degrees, of a great circle that is 6 zo. leagues, or 1860 iniles.

Ifthe latitudes be not both equall, and alfo of
-
one denomination, leauing one foote of thecompaffes in the crofsing of the fine or perpendicular difcending from the poynt of the greater latizude, with thother foot make a prick in the fame diameter,wherein that crolsing is: Thenif the latitudes

 be

## el correction of Errors

be both of one denomination, take with the com: paffes the-tength of the perpendicular or fine drawne from the poynt of the lefler latitude : and fetting one foote in the poynt of the greater latitude, with the other make a pricke in the perpendicular defcending from it, that is, in the fine therof: Take the diftance of this pricke from the former, made in the diameter : This diftance tranfferred into the circle (as in the firft example) wil giue you the diftance of the places giuen.

As London and Hierufalem haue both northerly and vnequall latitudes, Hierufalems latitude being onely 32 degrees. Firft therefore note in the circle both their longitudes: the longitude of London (pis. 22 degrees) as before with B: The longitude of Hierefatem ( 68 degrees) note with M. Let the perpendicular or the fines of the latitudes of LONdonand Hierufalem, E F,and NO be drawne as in the former examples. Make $F P$ equall to $O F$, and $P$ Qequall so NO. The pace betwixt $P$ and $Q$ taken with the compaffes, and then both feete fec in the circle (in fuch fort as the firft example was fhewed) hall containe betweene them the defired diftance of Hjerufalem from Eondon, 35 degrees, and about that is.7.75- leques, which are 2325 miles.

But if the latitudes be of diuers denominations, (that is, one northerly and the other foutherly) continue forth the perpendicular (that crofleth the diameter, wherin the forefayd prick was made) cill it be equall to both perpendiculars, that is, to the fines of both latitudes. The diftance of the

ende of this continued perpendicular from the pricke aforefayd in the diameter, taken with the compaffes, and tranflated into the graduated per1phery of the circle(as before) will Shewe you how

L many.

## A.roxréttion of.Eurors

many degrectrof a great circle are coutained betweenebert dataces.
Tethute " ${ }^{2}$ trs mater witionce example, fuppofe y. Wiould know toow farre Cufio in Pcivs is from London Ler The longitude of Cufiobe 295 degress, the latifuda in degrees fouthenly : The lorigirude of Lowfon, as before, 2 2 degrees, the latitude sidegrees, 32 miputes. From both thele longitudes noted in the citcle with $B$ and $R$, draw the diameters,

 ifrs or finex of therr layitudds E E and T S. Make FK equell toे ES the diftapee of thole Sincs, and EiY equall io SJ phe line of Cufcoes latitude. Take che diftance, Y X beqweere the fecte of the conpafles, and tert 1 'gm both io the circumference of the cirete, as in he firfte exampl,to ghall you finde that there are bet wixt LQudon and $\subset$ 'if co almert 27 , Cegrees, of a great circle that is 3940 leagues or 5820 miles.

Ifyou had rather kcepe trithin the compaffocof, the citche make the perpenticular X Z equyf to ST, and proceede with E Z as you did óróre Dinh X $\%$.

the line fubtending the diftance of London and S . Thomas Iland by the 2.e.7.Ra.4.26.pr.I.Eucl.

Alfo, becaufe all the fines of latitude (becing perpendicular to the fame plaine of the equinoettall) are parallels, by the 5.c 21. Ram 6.pr.it.Eucl. Thercfore by the 11.c2. Ram.or 35 d.I.Euc.F L is the line fubtending the diftaunce of London and Cape Blanco.

Againe, becaufe FP wherero EF is perpendicular is inade ęquall to FO, (the diftance ot the fines of London and Hierufalem, to which (diftance) EF is alfe perpendicular in the globe) and EQ alfo equall to NO: Therefore FQ being the difference of the fines of Londons and Hierufalems latitudes : there muft needs be the fame diftance betwixt $P$ and $Q$ that there is betweene the toppes of the fines of Hierufalems and Londons latitudes in the globe.
Laftly, FX being equal to FS (the diftance of the fines ot latitude ot London and Cufco in Peru) \& $X Z$ perpendicular to $F X$, and xquall to $S T$ the fine of Culcoes latitude: as EF is the fine of Londons latitude and perpendicular to the fame line XF: EZ (to which XY is equall by the 6. c 12 . es Ram.33.pr, 1. Excl. YE being equall and parallel to XZ muft needes be equall to a ftreight line extended within the globe betweene the points of latitude of Cufco and London.

Now out of this demonftration it were an eafie matter (if any lift take the paines to be fo curious) to find out the diftance of any two places arithme. tically by the doatrine of errangles, hauing alwates

## in the Jea Cbart.

two fides giuen which are the fincs of the comple: nents of the latitudes of the twoo places as OP, FP: LP, FP: RP, FP: AP, FP: together with the angle intercepted that is the difference of theis longitudes : whereby FA: FO: FL:FS, the diftances of the fines of latitude being found by the 2,3 , 4, S, Copernic. de Triangulis planic, the lines alfo fubrending the diftances of the places may molt cafily be foünd by the 3. Copernic. de Triang. plan. For the fquares of the diftance of the fines, and of the difference of the fines of their latitudes (ifboth be northerly or borh foutherly) or of the fumme ot the fines of their latitudes (if one be northerly another foutherly) are equall to the fquare of the line fubtending the diftance of the places s. e 12. Ram.47. pr.I. Ewcl.

With no leffe facilitie alfo by helpe of the former Tables,and the Canon of Triangles, any tw:o places being given, there may atithinetically and moft exaaly be found out, firf, by their longitudes and latitudes, the rumbe, and diftance meafured in the rumbe : fecondly, by their difarice, and latitudes, the rumbe and difference of longitude: thirdly, by their rumbe, and latitudes, the diatance and difference of longitude:fourthly, by their longitudes, rumbe, and one latitude, the other latitude and diftance: fiftly, by the rumbe diftance and one latitude, the other latitude, and the difference of longitude : or any other nauticall or geographical probleme that by the Chart may moechanically be performed : and the whole Arte of Nauigation arithmeticall (as fome call it) may as cafily be pra-

L 3 aircd:

## eA:corretionof Errors

Atifed : So' as, hauing onely the longitudes and latisudes of the places (by which, and to which you are to (aile) (ret downe in a Table, you may by axithmeticall calculation oncly (if you lift take the paines) without any chart,mappe, or globe, hhewe the courfe and diftance from anie place to other : and fo giue moft exat direation for the perfourmaunce of an whole voyage to any knowne place aisigned, how oft foeuer you haue trauerfed or bin tofled this way and that way by realon of fcant, violent, or contraty windes, or ainy other occafion.

Bur fecing the firft groundes of this Art, that is, the obleruations of the latitudes, but efpecially of the courfes at fea, cannot bur be farre ftom fuch exquifite trueth as is to be found in thofe arithmeticall operations: howe exat focuer you be in tife reft. of the meanes, you cail look for no more truth in condufion then fuch as is anfwerable to the firft igroundes and principples, out of which the conclufirn is's gathered. So as the Marineriballsor need tortrouble hinabolfexiny further herewith, but only itoccaft w.p his acooubrs vpon the chat truly made (dedeffyre is hhewd)w hich of alother is moff fit \& ready for hus ordinarie *fe. Now therefore it midy bet diffidiem, onidy to :hewe how the former Probtemes may mechancally be performed vpon the nauticall planiifpharebectore deforibed.
$\because$ Fieft, By che langitudes aided larizudes effoth places given; odiorumbe and diftanco maythigs be found: drawc parattes by both lathades crake the diftance ofth गre parallels: accordinewg to whichidiflance drawea parallet to thexquthoetiall. Thieh
from

## in the fea Cbart.

from the end of the difference of longitude reckoned from the concurle of the rumbes in the aquinoctiall erect a perpendicular croofsing the faide paralle: A line drawn by this crofsing from the concurle of the rumbes is the rumbe of the two places. Now to finde out the diftance, take to manie degrees of the xqunoctiallas the the difference of latitude containeth : and guidng one toote of the compalles in the $\begin{gathered} \\ \text { quinotiall, with the other foor }\end{gathered}$ corricd parallel- wilc at gquall diftance from the $x$ quinoetiall, crofle the rumbe newcly found out: take the diffaunce of this crofing from the con: curfe of the rumbes, and fer bort fecte of the Com-
 ted hew you the diftance defiried.
Secondy, By the diftance \& latitudes (knawing which. place is more caltwardes, or weftwardes) the rumb se difference of longıude is thus.found: Take with she compalics io many degrecsand mbnutes of the xquinoctiall, as the difference of latitude containech: According to thatdiftance draw a parallel to the aquinoctiall, take fo many degrees of the xquinoctalll with your Compales as the diftaoce giuen conimerh to : thengope fogac being fet in the concurfegt the pumbesinthe squinoct allt with ghe other croffe the paraded aforfigide : $\AA$ line drawnc by that crossiog from the concurle of the rumbes in the aquinoctaal giuct you the rumbe defired. Thfn both Jatitudes heing noted n the graduated meriala, thercin take their $d$ ffeence wich the compalies, and guidng one foote in the equincertidh, , with the otber carrich at that

## A correction of Errors

diftance parallel-wife from the xquinotiall, crofte the rumbe of the places : the diftance of that croffing from the meridian (that commeth from the common meeting of the rumbes in the qquinoctiall) taken with the compiffes, and brought to the ६quilloctiall, hal hew you the difference of longicude. Or a perpendicular to the qquinoctiall trom that crofsing fhal poynt you out therem, the difference of longtude.

Thurdly, By the rumb and laritudes (being borh northerly or both loutherly) the diftance and difference of longitude is thus found: Take the difference of latitudes in the xquinoctiall: according to that diftance draw a parallel to the xquinoctiall(as before) crofsing the rumb of the two places giuen: take the diftance ef this crofsing trom the concurfe of the rumbes : Then both feete of the compaffes fet in the xquinoctiall wil hew the diftance of the places. The difference of longitude is found as before.

Fourthly, By the longitudes rumbe and one latitude (knowing whether it bee the leffer or greater) to finde the other latitude, and the diftance,do thus: From the concirrfe of the rumbes in the $\varepsilon$ quino\&iall count the differcnce of longitudefform hence ereft a perpendicular crofsing the rumbe: the diftance of this crofsing from the qqunoatiall tranfared into the graduated meridian (letting one toose in the knowne latitude, and extending the other northwardes or fouthwardes according as the vnknowne latitude is greater or leffer) mall flew you the latitudedefired. Now to finde the diftance
of tho R nimniffe.:
diftance workeas before in the firt Probleme:
Fiftly, by the rumbe, diftance,and onc latitude, you may find the other latitude and the difference of long itude atter this manmer: Take the diftance guen with the Compaffes in the xquinoctiall:let one foute in the concurle of the rumbes, and with the other croffe the rumbe giuen : from this croffing drawe a perpendicular to the equino atiall:the length ofthat perpendicular taken with the Compalfes and brought into the eqquinoctiall hal hew you the difference of latitude. Thus hauing both latitudes giuen, the difference of longitude may alfo befound as before Prob. 2.
Nowe in euery one of thefe problemes there may be fome particular cafes wherof fome diuerfitie of working may tollow, yet fuch as can breed but fmall trouble to him that well thall conceiue the reafon of that is already fet down in thele fiue tormer Problemes : which are elpecially to be applied to fuch places as are both on the fame fide of the requinoetiall, and differ alfo both in longitude \& latitude:of which fort is the greateft number, and in which the greateft vfe, and moft difficultie of working confiltech. To profecute euery particularitic ar large (whereof fome perhaps leffe acquainted with the reafon of thefe mathematical practifes may be defirous) would be now for mee too long and tędious. For fome tafte therefore
of the vfe of this nauticall planifphęce,
let thus much forthis time
briefly fuffice.
